David Galvez
Due 4/9/12

CSSE376 – Lab 6

1. Internationalization is the process of writing code so that it can be easily adapted into other languages and cultures without having to make major changes. Localization is the actual process of translating and adapting the program.
2. Assuming you're making software for an international bank, you'll need to write it so that anyone of any language or currency can use it. The international bank will not be happy with a program that only works domestically. Thus internationalization and localization allow for the program to meet a wider variety of needs, and thus appeal to more customers, as well as being far more standardized, meaning that it makes it easier for the same program of different languages to communicate.
